Upgrade CO₂ and biogas to syngas using solar energy

CO₂ of the biogas is actively converted into syngas, with the perspective to synthesize liquid chemicals, rather than being simply discharged to the atmosphere.

Solar technology

- based on linear-parabolic troughs with a receiver reactor

- receiver-reactor acts as catalytic reactor activated by solar energy to convert the CO₂/biogas into syngas by means the dry reforming reaction.

Patented research

- features external transparent wall, internal transparent catalytic support

- the catalyst itself is also transparent thanks to a completely new deposition technique and allows to overcome some energy transfer inefficiencies typical of thermal solar plants.

CE-SC3-NZE-2-2018: Conversion of captured CO₂

LC-SC3-RES-7-2019: Solar Energy in Industrial Processes

- Innovative valorization paths using CO₂. Can be integrated with CO₂ to methanol paths.
- Integration opportunities with existing facilities
- Technology equally applied to CO₂ and CO₂/CH₄ gas streams
- Enhancement of the industrial installed capacity for advanced biofuels.
- Pave the way for the commercialization of advanced biofuels

EXISTING PROJECT CONSORTIUM/ or LOOKING FOR PARTNERS

#	Organization	Country	Type
1	PARTNER 1	Italy	Industry
2	PARTNER 2	Italy	Industry
3	PARTNER 3	Italy	RTO
4	PARTNER 4	Belgium	RTO
5	PARTNER 5	France	Industry
6	PARTNER 6	Greece	RTO
